

A) Norm-Position Correlation: Training Destroys Signal

B) Position Decodability from Norm

C) Position in Directional Structure

KEY FINDINGS: Random vs Trained Models

Metric	Random	Trained
Norm-Pos Corr (post-LN2)	-0.97	+0.15
Norm R^2 (post-LN2)	0.94	0.02
Direction R^2 (post-attn)	0.23	0.18

CONCLUSION:

- The norm-based position encoding is an emergent property of RANDOM initialization
- Training DESTROYS this mechanism
- Trained models must use a different (unknown) mechanism for position awareness
